

# Run Your First JavaScript Program

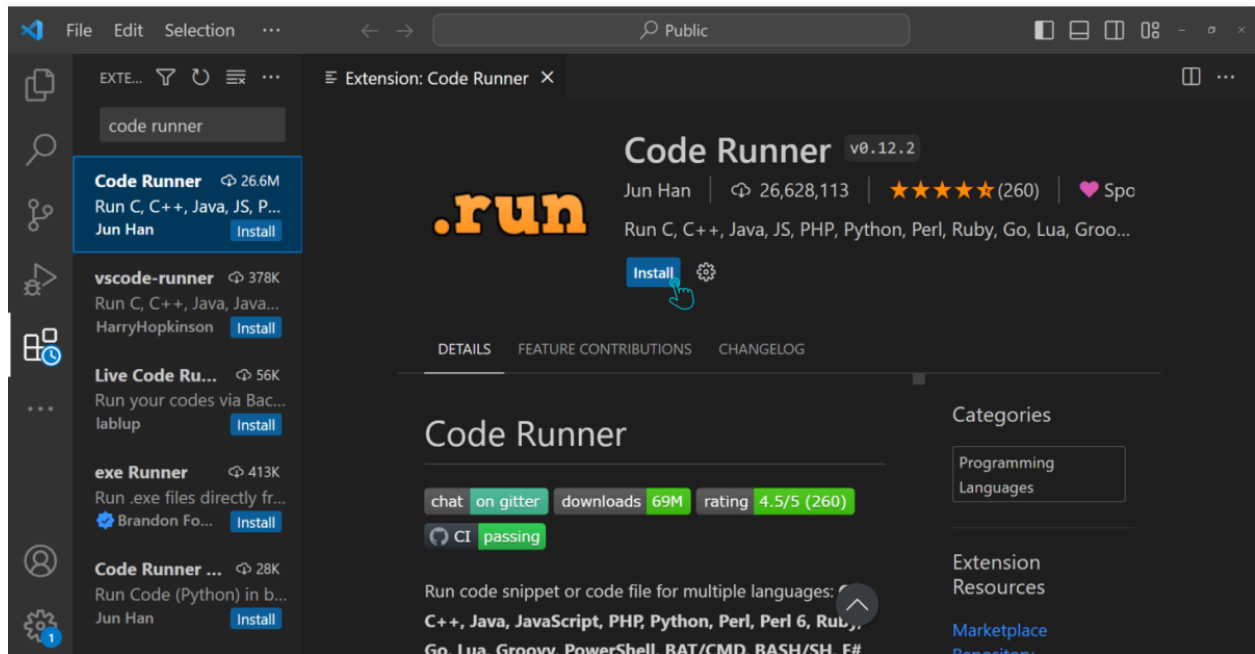

First open VS Code, click on the File in the top menu and then select New File.

Create a New File in VS Code

Then, save this file with a .js extension by clicking on File again, then Save As, and type your filename ending in .js. (Here, we are saving it as helloWorld.js).

Before you start coding, make sure the extension Code Runner is installed in VS Code. Open VS Code and click on Extensions on the left sidebar. Then, search for the Code Runner and click on install.

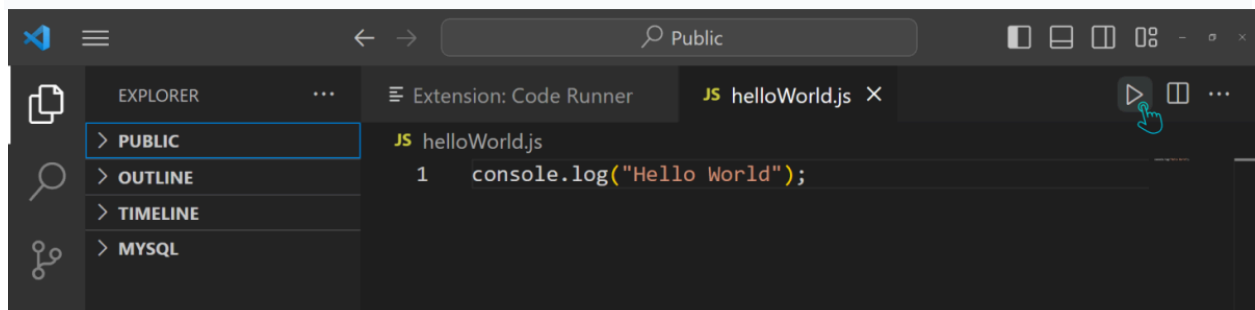

#### JavaScript Extension in VSCode

Now, write the following code into your helloWorld.js file:

```
console.log("Hello World")
```

Then click on the run button on the top right side of your screen.

#### JavaScript Run Program

You should see Hello World! printed to the output.

Now that you have set everything up to run JavaScript programs on your computer, you'll be learning how the basic program works in JavaScript in the next tutorial.
